Probability Mass Function

Random Experiment is a discrete random variable then the

Random Experiment is an function of all possible outcomes of the experiment in which the result will not be known in advance is called Random Experiment.

Sample Space (S)

A sample space is a set of all possible outcome of an Random Experiment is called sample space.

Eg:- Toss a Coin.

$$S = \{H, T\}$$

Probability

$$P(A) = \frac{n(A)}{n(S)}$$

- $f(x) \in \text{sample space}$
- $\sum f(x) = 1$

Conditional Probability

$$P(B/A) = \frac{P(A \cap B)}{P(A)}$$

I think?

$$P(A/B) = \frac{P(A \cap B)}{P(B)}$$

as in transpose matrix

Types of Random Variable

- 1) Discrete Random Variable
- 2) Continuous Random Variable.

Discrete Random Variable

A random variable x which can take a finite number of values is called discrete random variable.

Continuous Random Variables

A random variable x which can take an infinite number of values is called continuous random variable.

Probability Mass Function

Let 'x' be a discrete random variable then the function

$$P(x = \underline{\underline{x}}) =$$

$$P(x = x_i) = P(x_i) = p_i$$

said to be probability mass function.

If

$$\text{i)} P(x_i) \geq 0 \quad \forall i = 1, 2, \dots$$

$$\text{ii)} \sum_{i=1}^{\infty} P(x_i) = 1 \quad \text{or Distribution}$$

Probability Density fn.

Let 'x' be a continuous random variable then the function $f(x)$ is said to be probability density fn

If

$$\text{i)} f(x) \geq 0$$

$$\text{ii)} \int_{-\infty}^{\infty} f(x) dx = 1$$

7) Out of 800 families with 4 children. Each, for how many families would be expected to have

i) 2 boys + 2 girls.

ii) at least 1 boy.

iii) at most 2 girls.

iv) both are genders.

Soln:-

Let x be the no. of boys in the family.

$$P = \frac{1}{2}, q = \frac{1}{2} \quad [\because p+q=1]$$

$$n=4, \frac{21}{32} = \frac{21}{32} \cdot \frac{4}{16} = \frac{4}{16} = 0.25$$

Binomial formula

$$\text{and } P(\epsilon = x) = (1-x)^9 + (0=x)^9 \\ = \frac{8}{16} + \frac{3}{8}$$

$$= \frac{1}{2} + \frac{3}{8} = \frac{7}{8} = (1-x)^9 + (0=x)^9$$

Out of 800 families:

Problem based on Poisson Distribution

8) If x is a Poisson variate such that $P(x=0) = \frac{1}{3}$

$$P(x=x) = \frac{e^{-\lambda} \lambda^x}{x!}$$

Mean = λ , Variance = λ .

8) If x is a Poisson variate such that $P(x=1) = \frac{3}{10}$ and $P(x=2) = \frac{1}{5}$.

Find $P(x=0)$ and $P(x=3)$.

Soln:-

$$P(x=x) = \frac{e^{-\lambda} \lambda^x}{x!}$$

$$P(x=1) = \frac{e^{-\lambda} \lambda^1}{1!} = \frac{3}{10} \quad \text{--- ①}$$

$$P(x=2) = \frac{e^{-\lambda} \lambda^2}{2!} = \frac{1}{5}$$

$$e^{-\lambda} \lambda^2 = \frac{2}{5} \quad \text{--- ②}$$

Solving eqn ① & ②, we get

$$\frac{②}{①} \Rightarrow e^{-\lambda} \lambda^2 = \frac{2}{5} \quad \text{[Cross multiply]} \\ e^{-\lambda} \lambda = \frac{2}{5} \quad \text{[Divide by } \lambda]$$

Let $\lambda = \frac{2}{5} x \frac{10}{3}$ to meet above

guarantee qualities = λ more than $\lambda = 4/3$ (1 in 3 will be defective).

$$P(x=0) = \frac{e^{-4/3} (4/3)^0}{0!} = \frac{e^{-4/3}}{1} = \frac{e^{-4/3}}{1} \quad [\because 0! = 1]$$

$$P(x=3) = \frac{e^{-4/3} (4/3)^3}{3!} \quad \text{[using variable } \lambda]$$

$$P(x=2) = 90 \cdot P(x=4) + 90 \cdot P(x=6)$$

$$= 64/27 \quad \text{[using formula for } P(x)]$$

$$= 64/27 \quad \text{[using formula for } P(x)]$$

$$+ (1-x)^9 + (1-x)^9 + (1-x)^9 = (1-x)^9$$

9) A manufacturer of pins knows that 2% of his product are defective. If he sells pins in boxes of 100 he guarantees that not more than 4 pins are defective.

i) What is the probability that a box will fail to meet the guarantee quantity? [$e^{-2} = 0.13534$].

Soln

$$n = 100$$

$$P = 2\% = 2/100 = 0.025.$$

$$\lambda = np.$$

$$= 100 \times 0.025 = (0-x)^q$$

$$= 2.$$

The Poisson distribution is given by,

$$\frac{e^{-\lambda} \lambda^x}{x!} = (e-x)^q$$

$P(\text{not more than 4 pins will be defective})$.

$$P(X \leq 4) = P(X=0) + P(X=1) + P(X=2) + P(X=3) + P(X=4).$$

$$= \frac{e^{-2} 2^0}{0!} + \frac{e^{-2} 2^1}{1!} + \frac{e^{-2} 2^2}{2!} \\ + \frac{e^{-2} 2^3}{3!} + \frac{e^{-2} 2^4}{4!}$$

$$= \frac{0.13534 \times 1}{2!} + \frac{0.13534 \times 2}{1!} + \frac{0.13534 \times 3}{0!} \\ = \frac{0.13534 \times 4}{4!} + \frac{0.13534 \times 8}{3!} + \frac{0.13534 \times 16}{2!}$$

$$= 0.13534 + 0.27068 + 0.27068 + \\ 0.18045 + 0.09022$$

$$= 0.94737.$$

(ii) $P(\text{a box will fail to meet the guarantee qualities}) = P(\text{more than 4 pins will be defective}).$

$$P(X > 4) = 1 - P(X \leq 4).$$

$$= 1 - 0.94737.$$

$$= 0.0526.$$

10) If X is a poisson variable.

$$P(X=2) = 9p(X=4) + 90p(X=6).$$

- Find i) Mean of X
ii) Variance of X .

Soln:-

$$P(X=2) = 9p(X=4) + 90p(X=6)$$

$$\frac{e^{-\lambda} \lambda^2}{2!} = 9 \left(\frac{e^{-4} \lambda^4}{4!} \right) + 90 \left(\frac{e^{-6} \lambda^6}{6!} \right)$$

$$(4-1) = 9 \cdot \frac{8}{24} + 90 \cdot \frac{1}{720} = 1$$

$$\frac{e^{\lambda} \lambda^2}{2!} = e^{\lambda} \lambda^2 \left[\frac{9\lambda^2}{4!} + \frac{90\lambda^4}{6!} \right]$$

$$\frac{1}{2} = \left[\frac{9\lambda^2}{24} + \frac{90\lambda^4}{720} \right]$$

$$\frac{1}{2} = \frac{3\lambda^2 + \lambda^4}{8}$$

$$3\lambda^2 + \lambda^4 - 4 = 0$$

$$\text{root will be } \lambda = \pm 1$$

$$\lambda = \frac{-b \pm \sqrt{4ac}}{2a}$$

$$\frac{-3 \pm \sqrt{9 - 4(1)(-4)}}{2(1)}$$

$$\lambda^2 = -3 \pm \sqrt{9 + 16}$$

$$(s-x)q \text{ or } \frac{(s-x)q}{2} = (s-x)q$$

$$\lambda^2 = -3 \pm \sqrt{25}$$

$$(s-x)q = -3 \pm 5$$

$$\frac{(s-x)q}{2} = \frac{(-3+5)}{2}, \quad \frac{(s-x)q}{2} = \frac{(-3-5)}{2}$$

$$\lambda^2 = \frac{2}{2}, \quad \lambda^2 = (1, -4)$$

$$\lambda = \pm 1, \quad \pm 4$$

$$\lambda = \pm 1, \quad \pm 2$$

$$\therefore \lambda = 1$$
